Risk stratified early detection

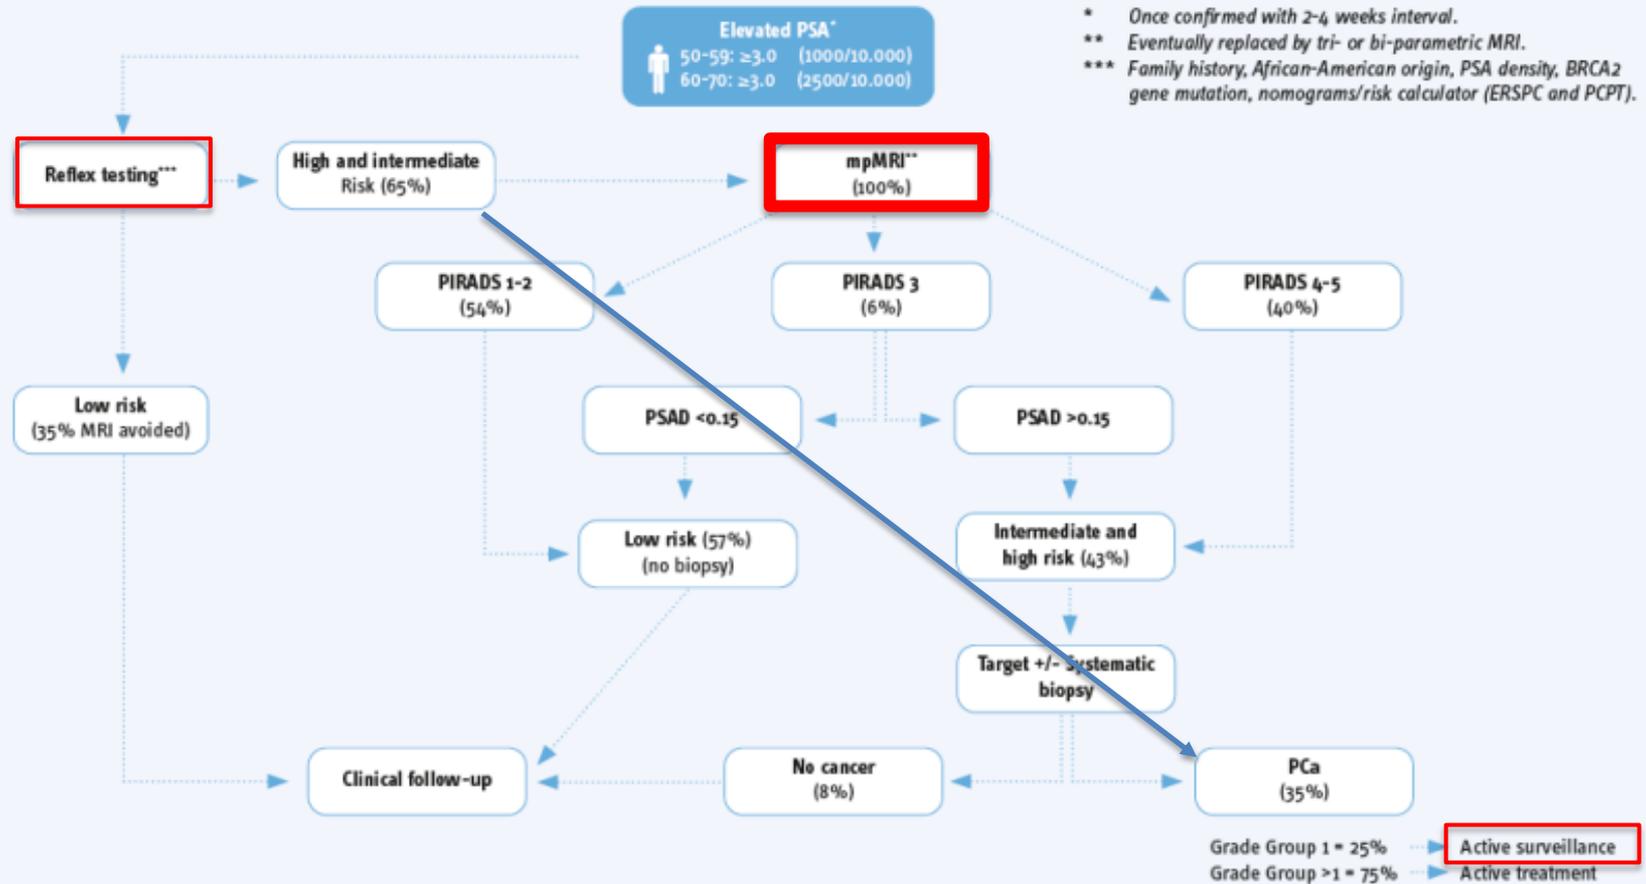

Risk Calculators: ERSPC and PCPT

Abnormal PSA ~~≠~~ Biopsy

Risk stratified early detection

How to eliminate the 2nd major cancer killer of men in Europe?

The way forward for the EU

Our recommendations

- Use PSA testing properly
 - well-informed men 45-50 till >10 y life expectancy
 - risk calculators, age-related PSA, PSAD, (biomarkers) and MRI
 - Biopsy those at risk for significant cancer
 - Treat actively (RPr or RT) those at risk to die from PCa
 - Manage with active surveillance those with low (and some with intermediate) risk
- ⇒ Decrease PCa cost, decrease mortality and improve Quality of Life**

Conclusions

1. Early detection saves lives
2. Prostate cancer deaths can (rather easily) be dramatically reduced
3. Our adult male population and GP's need to be informed
 - "If you do not want to die from PCa ..."
 - No uninformed mass screening
 - A well informed healthy men should be offered early detection
